User Manual – Two-Player Strategy Game

1. Introduction

This program is a two-player strategy game played on a 6×6 board. Each player controls six pieces of different sizes. The objective of the game is to move one of the pieces all the way to the opponent's side of the board. Players take turns selecting and sliding their pieces until one player reaches the opposite edge and wins the game.

2. Starting the Game

To launch the game, you need three files: `main.c`, `board.h`, and `board.o`. You can run the game using a single command in a Linux terminal or within an IDE.

```
gcc -Wall board.o main.c -o game.out && ./game.out
```

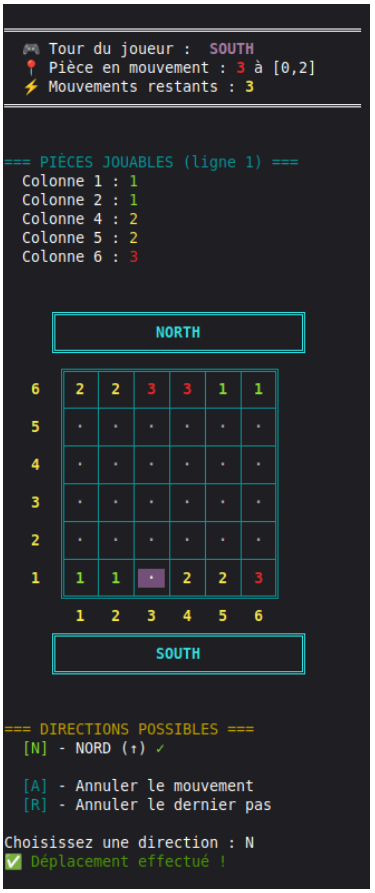

Once the game starts, a welcome screen is displayed, showing the rules and instructions for the pieces and their sizes.

3. Placing the Pieces

At the beginning of the game, each player places their six pieces alternately, starting with two pieces of each size. First, you choose the piece size by typing 1️⃣, 2️⃣, or 3️⃣. The color of the piece indicates its size: **green** represents size 1 (1 step), **yellow** represents size 2 (2 steps), and **red** represents size 3 (3 steps). After selecting the size, you choose the column where you want to place the piece by typing a number from 1 to 6. If the column is full or invalid, the game will ask you to choose again. The game automatically selects the correct line on your side. Once all pieces are placed, the game continues automatically to the main game loop.

4. Taking a Turn

During your turn, you can move one of your pieces. Only pieces on your furthest line (South or North) can be moved. You select a piece by entering its line (1–6) and column (1–6). After selecting a piece, the game displays the possible directions you can move it. The directions are: G for GOAL (to reach the opponent's goal), N for North (↑), S for South (↓), E for East (→), and O or W for West (←). Additionally, two special commands are available: A to cancel the whole movement and R to undo the last step. Each piece can move a maximum number of steps equal to its size. The game automatically checks whether a move is allowed. If a move is impossible, the game notifies you, and you can choose another direction.

5. Special Swap Move

Once a piece has finished moving, if it ends on another piece, a special swap may be possible. You are prompted to confirm the swap by typing O for yes or N for no. If you want to do the swap, you enter the line and column of the piece you want to swap. The game will notify you whether the swap succeeded or failed.

6. Ending the Game

The game continues with players alternating turns until a piece reaches the opponent's goal. When a player wins, the game displays a special message indicating the winner. You can then close the game, and all memory is automatically cleaned up.

7. Tips

Always pay attention to which pieces are available before making a move, and plan your turns carefully. Use the A command to cancel a movement if you make a mistake, or the R command to undo the last step. Try to anticipate the opponent's moves while focusing on reaching their goal, and protecting key positions on the board.
